

cfabort

Description

Stops processing of a page at the tag location. Railo returns everything that was processed before the cfabort tag. The cfabort tag is often used with conditional logic to stop processing a page when a condition occurs.

Category

Implemented

Usage Syntax

```
[showError="String"]  
[type="String"]  
/>
```

[] = Optional attribute

Attributes

Name	Type	Required	Default	Description
showError	String	No		The error to display when cfabort executes. The error message displays in the standard CFML error page.
type	String	No		Define if only current page execution will aborted or the whole request. Values are "page" for the current page or "request" for all.

Example Usage

Example 1:

```
variables.foo = "2">  
#variables.foo#  
  
<--- This will never run as we have halted processing --->  
variables.foo = incrementValue(variables.foo)>  
#variables.foo#
```

Example 2:

```
variables.foo = "2">  
variables.msg = "This is an custom error that I can write. This will display as a message to the user and all processing is halted.">  
showError="#variables.msg#">  
#variables.foo#
```
