Example Usage

Example:

In this example we will show how to vary the display results of a database query, which can be manipulated by using a very simple comparison expression in the CFIF tag.

```
<--- Fetch the list of countries --->
  name="getCountries" dbsource="regionalData">
SELECT country_ID, country_Name, country_Capital
FROM countries
ORDER BY country_Name

<--- Display our results using different conditions --->
```

Using the CFELSE tag we can list all the countries and empathize the ones which start with A or Z and strongly emphasize the countries that start with U.
