

Railo & Resin Installation

OS X

- [Installing Railo 3.1 with Resin On Mac OS X 10.6 \(Snow Leopard\)](#)
- [Installing Railo 3.1 with REsin On Mac OS X 10.5 \(Leopard\)](#)

Virtual Host Tip

Tip by Matthew Williams of geodesicgrafx.com

1. Create a folder called "hosts" in the main railo directory.
2. Create a folder that exactly matches the domain name you're using eg "www.mystuff.com". This means you'll also have to create a "mystuff.com" to capture those that leave off the "www" part.
3. Create a host.xml file in the domain folder format it as:

```
root-directory="c:/myfolder" xmlns="http://caucho.com/ns/resin">
  www.mystuff.com
  id="/" root-directory="." />
```
